

Radial Hinged Ulnar Deviation Splint

Application Instructions

The finger loops should be adjusted individually for the best correction. Use the straps to pull each finger towards the thumb (radial) side of your hand and then fasten the hook tabs.

Adjust the finger strap as needed to bring the fingers into alignment. Once adjusted, it may be possible to slide the fingers in and out of the splint without reopening the finger strap.

The side hinges allow you to freely open and close your hand.
