Injector Installation Kits - Cummins B and C Engines Valve Cover Gasket - Cummins C Engine

Injector Installation Kits

To support the fuel injection shops as the population of Cummins B and C series engines increases, DIPACO has developed a series of injector installation kits for these engines. Each kit is designed for the installation of one injector to simplify stocking for either 4 or 6 cylinder engines. Below and continued on the back you will find a contents listing of the various installation kits. These kits will be available in mid-January.

The basic installation kit, **DPE59010**, includes the o-rings, dust seal, and washers needed to install the injector. It includes three different sizes of nozzle washers to accommodate the various injector tips. The thin (1.5mm) 7mm inside diameter nozzle washer is used in all early B series engines (except 1991 automotive) and C series engines. The thick (2.5mm) 7mm inside diameter nozzle washer is used in 1991 B series automotive applications. The 5mm inside diameter washer is used in later B and C series engines. There are also three installation kits for specific nozzle tip sizes.

We also have injector and valve cover installation kits. The base kit, **DPE59020**, includes the **DPE59010** kit plus the valve cover gasket and the noise isolator which is installed on the top of the valve cover. We also have three additional injector and valve cover kits for specific nozzle washer sizes. In every engine one of the valve covers is the oil fill cylinder. To accommodate this, we have an injector and valve cover kit, **DPE59030**, which includes the oil fill seal ring. Again, there are also three specific nozzle washer sized kits as well.

Valve Cover Gasket

Many C series engines use as a valve cover gasket a 7 foot strip of rectangular silicone which is fit into the valve cover, like what some Mack applications use. DIPACO now has the **D3905449** gasket available.
